

# **ICAPS 2024: Tutorial**

## **AI Techniques for Solving Scheduling Problems**

**Lucas Kletzander, Nysret Musliu, Florian Mischek**

Christian Doppler Laboratory for Artificial Intelligence and  
Optimization for Planning and Scheduling

Institute of Logic and Computation, DBAI

Faculty of Informatics, TU Wien

# Outline

---

- Scheduling Problems: Case studies
- Solution techniques
  - Solver-independent modelling
  - Constraint programming
  - Metaheuristic techniques
  - Hybrid methods
- Automated algorithm selection and instance space analysis
- Automated algorithm design/Hyper-heuristics
- Industrial applications

---

# Scheduling Problems: Case studies

# Investigated Applications in our Lab

---

## **Rotating Workforce Scheduling**

Shift Design

Break Scheduling

Nurse Rostering

Torpedo Scheduling

Electric Vehicle Charging

Tourist Trip Planning

Social Golfer Problem

High School Timetabling

Production Leveling Problem

Parallel Machine Scheduling

Industrial Oven Scheduling

Physician Scheduling During a Pandemic

Unicost Set Covering

(Hyper)tree Decomposition

Graph Coloring

Traveling Salesman Problem

Vehicle Routing

Sudoku

Bus Driver Scheduling

## **Test Laboratory Scheduling**

Artificial Teeth Production  
Scheduling

Project Scheduling

Paint Shop Scheduling Problem

Curriculum-based Course  
Timetabling

## Employee Scheduling

---

- Work schedules influence the lives of employees
- Unsuitable timetable can have a tremendous negative impact on one's health, social life, and motivation at work
- Organizations in the commercial and public sector must meet their workforce requirements and ensure the quality of their services and operations

# Employee Scheduling

---

# Employee Scheduling

---

Real world employee scheduling problems appear in many companies

Airports

Call centers

Air traffic control

Hospitals

Public transport

Production plants

...

# Employee Scheduling Problems

---

## Phase 1: Workforce requirements

# Employee Scheduling Problems

## Phase 1:

Workforce requirements

## Phase 2:

Shift Design/Break Scheduling

# Employee Scheduling Problems

## Phase 1:

Workforce requirements

## Phase 2:

Shift Design/Break Scheduling

## Phase 3:

Assignment of shifts

	Mo	Di	Mi	Do	Fr	Sa	So
A	F	F	F	S	S		
B		N	N	N	N		
C		F	F	N	N	N	N
D			S	S	S	N	N
E	N			F	F	S	S
F	S			F	F	F	F
G	S	S				F	F
H	F	S	S			S	S
I	N	N	N				

Selected papers: [3,4,11,12, 13]

## Example: Rotating Workforce Scheduling

---

Length of schedule: If the schedule is cyclic the total length of a planning period will be:  $\text{NumberOfEmployees} \times 7$

	Mo	Tu	We	Th	Fr	Sa	Su
A	D	D	D			D	D
B	D	D	D	D			
C	A	A	A	A			A
D	A	A	A	A	A		
E	D	D	A	A	A		
F	A	A	N	N	N		
G	N	N	N	N	N		
H		N	N	N	N	N	
I			D	D	D	A	A
J				D	D	N	N
K	N				A	A	N
L	N	N			D	D	D

Number of  
employees

Employees working shifts:

D: Day shift ; A: Afternoon shift ,  
N: Night shift; Day off

# Constraints

	Mo	Tu	We	Th	Fr	Sa	Su
A	D	D	D		D	D	
B	D	D	D	D			
C	A	A	A	A			A
D	A	A	A	A	A		
E	D	D	A	A	A		
F	A	A	Z	Z	Z		
G	Z	Z	Z	Z	Z		
H		Z	Z	Z	Z	Z	
I			D	D	D	A	A
J				D	D	Z	Z
K	Z				A	A	Z
L	Z	Z			D	D	D

Not allowed sequences of shifts:

N - D
N D
A D
N A
A - A
A - D

Maximum and minimum length of periods of successive shifts.

e.g.: N: 2-5, D: 2-6

Temporal requirements:  
required number of employees  
in shift  $i$  during day  $j$

Monday (Mo): D: 3, N: 3, A: 3

Maximum and minimum length  
of work days and days-off blocks  
e.g.: days-off block: 2-4  
work block: 2-6

## Objective

---

Find a cyclic schedule (assignment of shifts to employees) that satisfies the temporal requirement, and all other constraints

Possible soft constraints:

- Optimization of free weekends (weekends off)
- Optimizing the distribution of weekends
- ...

# Test Laboratory Scheduling

---

## Input

- Scheduling period
- Resources
- Projects and Tasks
- Initial assignments

## Solution

- ① *Grouping* of tasks into jobs
- ② *Assignment* of
  - ▶ Execution mode,
  - ▶ Starting timeslot, and
  - ▶ Resourcesto each job

# Test Laboratory Scheduling

## Project 1

J ob 1  
(Tasks 1, 2, 3, 5)

$M_A : E_1, E_2 / WB_5 / EQ_4$

J ob 2  
(Task 4)

$M_B : E_1 / WB_3$

J ob 3  
(Tasks 6, 7)

$M_B : E_3 / WB_1 / EQ_8, EQ_9$

## Project 2

J ob 4

(Tasks 1, 2, 3, 5)

$M_A / E_1, E_2 / WB_5 / EQ_4$

Job 2  
(Task 4)

$M_B / E_1 / WB_3$

Job 3  
(Tasks 6, 7)

$M_B / E_3 / WB_1 / EQ_8, EQ_9$

## Project 2

Job 4  
(Tasks 8, 9, 10, 11)

$M_A / E_1, E_4 / WB_1$

Job 5  
(Task 12)

$M_B / E_2 / WB_1$

Job 6  
(Tasks 13, 14, 15)

$M_B / E_2 / WB_2$

Job 7  
(Task 16, 17)

$M_A / E_3, E_5 / WB_3$

# Task grouping

A job consists of one or several **tasks**, which define its properties:

- Available resources:  $\mathcal{R}_j = \bigcap \mathcal{R}_t$
- Time window:  $\alpha_j = \max \alpha_t, \omega_j = \min \omega_t$
- ...

# Production Planning and Scheduling

- In these applications it is important to
  - Reduce resource consumption, including energy
  - Increase production efficiency

# MinZinc

---

- Constraint modeling language
- Used for modeling constraint satisfaction/optimization problems
  - High-level
  - Solver-independent
    - Model is compiled into FlatZinc that is understood by a wide range of solvers (CP, MIP, ...)
- MiniZinc is developed at Monash University
- Free and open-source

# Example

Listing 2.1.1: A MiniZinc model `aust.mzn` for colouring the states and territories in Australia

```
% Colouring Australia using nc colours
int: nc = 3;

var 1..nc: wa;   var 1..nc: nt;  var 1..nc: sa;   var 1..nc: q;
var 1..nc: nsw;  var 1..nc: v;   var 1..nc: t;

constraint wa != nt;
constraint wa != sa;
constraint nt != sa;
constraint nt != q;
constraint sa != q;
constraint sa != nsw;
constraint sa != v;
constraint q != nsw;
constraint nsw != v;
solve satisfy;

output ["wa=\(wa)\t nt=\(nt)\t sa=\(sa)\n",
        "q=\(q)\t nsw=\(nsw)\t v=\(v)\n",
        "t=", show(t), "\n"];
```

# Rotating Workforce Scheduling: Constraint Programming

- Schedule representation where
  - $w$  ... the number of days in a week
  - $n$  ... the number of workers

M	T	W	T	F	S	S	M	T	W	T	F	S	S	...	M	T	W	T	F	S	S
$T_0$	$T_1$	$T_2$	$T_3$	$T_4$	$T_5$	$T_6$	$T_7$	$T_8$	$T_9$	$T_{10}$	$T_{11}$	$T_{12}$	$T_{13}$	...	$T_{nw-7}$	$T_{nw-6}$	$T_{nw-5}$	$T_{nw-4}$	$T_{nw-3}$	$T_{nw-2}$	$T_{nw-1}$

M	T	W	T	F	S	S
$S_{1,1}$	$S_{1,2}$	$S_{1,3}$	$S_{1,4}$	$S_{1,5}$	$S_{1,6}$	$S_{1,7}$
$S_{2,1}$	$S_{2,2}$	$S_{2,3}$	$S_{2,4}$	$S_{2,5}$	$S_{2,6}$	$S_{2,7}$
...						
$S_{n,1}$	$S_{n,2}$	$S_{n,3}$	$S_{n,4}$	$S_{n,5}$	$S_{n,6}$	$S_{n,7}$

$$T_k = S_{1+(k/w), 1+(k \bmod w)}$$

- Variable domains  $T_k \in \{D, A, N, O\}$

# Temporal Requirements

- For each day  $d$  in the week  $\sum_{i \in 1..n} (S_{i,d} = sh) = R_{sh,d}$  where
  - $sh \in \{D, A, N\}$
  - $R_{sh,d}$  ... the requirement for shift  $sh$  at day  $d$

	M	T	W	T	F	S	S
	$S_{1,1}$	$S_{1,2}$	$S_{1,3}$	$S_{1,4}$	$S_{1,5}$	$S_{1,6}$	$S_{1,7}$
	$S_{2,1}$	$S_{2,2}$	$S_{2,3}$	$S_{2,4}$	$S_{2,5}$	$S_{2,6}$	$S_{2,7}$
				...			
	$S_{n,1}$	$S_{n,2}$	$S_{n,3}$	$S_{n,4}$	$S_{n,5}$	$S_{n,6}$	$S_{n,7}$
D	2	2	2	2	2	2	2
A	1	1	1	1	1	1	1
N	1	1	1	1	1	1	1

$\sum_{i \in 1..n} (S_{i,7} = D) = 2$

$\sum_{i \in 1..n} (S_{i,7} = A) = 1$

$\sum_{i \in 1..n} (S_{i,7} = N) = 1$

## Global constraints

- Instead of a set of linear constraints for each day, using one global cardinality constraint

	M	T	W	T	F	S	S
	$S_{1,1}$	$S_{1,2}$	$S_{1,3}$	$S_{1,4}$	$S_{1,5}$	$S_{1,6}$	$S_{1,7}$
	$S_{2,1}$	$S_{2,2}$	$S_{2,3}$	$S_{2,4}$	$S_{2,5}$	$S_{2,6}$	$S_{2,7}$
				...			
	$S_{n,1}$	$S_{n,2}$	$S_{n,3}$	$S_{n,4}$	$S_{n,5}$	$S_{n,6}$	$S_{n,7}$
D	2	2	2	2	2	2	2
A	1	1	1	1	1	1	1
N	1	1	1	1	1	1	1

$\swarrow gcc([S_{1,7}, \dots, S_{n,7}], [D, A, N], [2, 1, 1])$

- Redundant constraint

$$gcc([S_{1,d}, \dots, S_{n,d}], [D, A, N, O], [R_{D,d}, R_{A,d}, R_{N,d}, R_{O,d}])$$

## Sequence constraints

---

- For each day  $d$  in the schedule
  - Maximal length constraints for  $D$ ,  $A$ ,  $N$ , and  $O$ 
    - For example, 4 for  $N$

M	T	W	T	F	S	S	M	T	W	T	F	S	S	...	M	T	W	T	F	S	S
$T_0$	$T_1$	$T_2$	$T_3$	$T_4$	$T_5$	$T_6$	$T_7$	$T_8$	$T_9$	$T_{10}$	$T_{11}$	$T_{12}$	$T_{13}$	...	$T_{nw-7}$	$T_{nw-6}$	$T_{nw-5}$	$T_{nw-4}$	$T_{nw-3}$	$T_{nw-2}$	$T_{nw-1}$

$$\sum_{i \in 0..4} (T_i \neq N) > 0$$

$$\sum_{i \in 0..4} (T_{8+i} \neq N) > 0$$

- Constraints for the maximal length  $maxWB$  for work blocks

$$\sum_{i \in 0..maxWB} (T_{d+i} = O) > 0$$

## Sequence constraints

---

- For each day  $d$  in the schedule
  - Minimal length constraints for  $D$ ,  $A$ ,  $N$ , and  $O$ 
    - For example, 3 for  $N$

M	T	W	T	F	S	S	M	T	W	T	F	S	S	...	M	T	W	T	F	S	S
$T_0$	$T_1$	$T_2$	$T_3$	$T_4$	$T_5$	$T_6$	$T_7$	$T_8$	$T_9$	$T_{10}$	$T_{11}$	$T_{12}$	$T_{13}$	...	$T_{nw-7}$	$T_{nw-6}$	$T_{nw-5}$	$T_{nw-4}$	$T_{nw-3}$	$T_{nw-2}$	$T_{nw-1}$

$$T_1 \neq N \wedge T_2 = N \rightarrow \sum_{i \in 1..2} (T_{2+i} \neq N) = 0$$

- Constraints for the minimal length  $minWB$  for work blocks

$$T_{d-1} = O \wedge T_d \neq O \rightarrow \sum_{i \in 0..maxWB} (T_{d+i} = O) = 0$$

- 
- For each day  $d$  in the schedule
    - Forbidden sequences of length 2
      - For example,  $ND$

$$T_d = N \rightarrow T_{d+1} \neq D$$

- Forbidden sequences of length 3
  - For example,  $N-D$

$$T_d = N \wedge T_{d+1} = O \rightarrow T_{d+2} \neq D$$

# Symmetry Breaking Constraints

---

- Day-off at the last day in the schedule  $R_{O,w} > 0 \rightarrow S_{n,w} = O$
- Work day at the first day in the schedule

$$((\forall sh \in \{D, A, N\}, \forall j \in 2..w : R_{sh,j-1} = R_{sh,j}) \vee (R_{O,1} < R_{O,w})) \rightarrow S_{1,1} \neq O$$

# Test Laboratory Scheduling: Constraint Programming

Major challenge: Representing grouping

Solution: Representative task for each job

## Example Constraints

---

Resource availability:

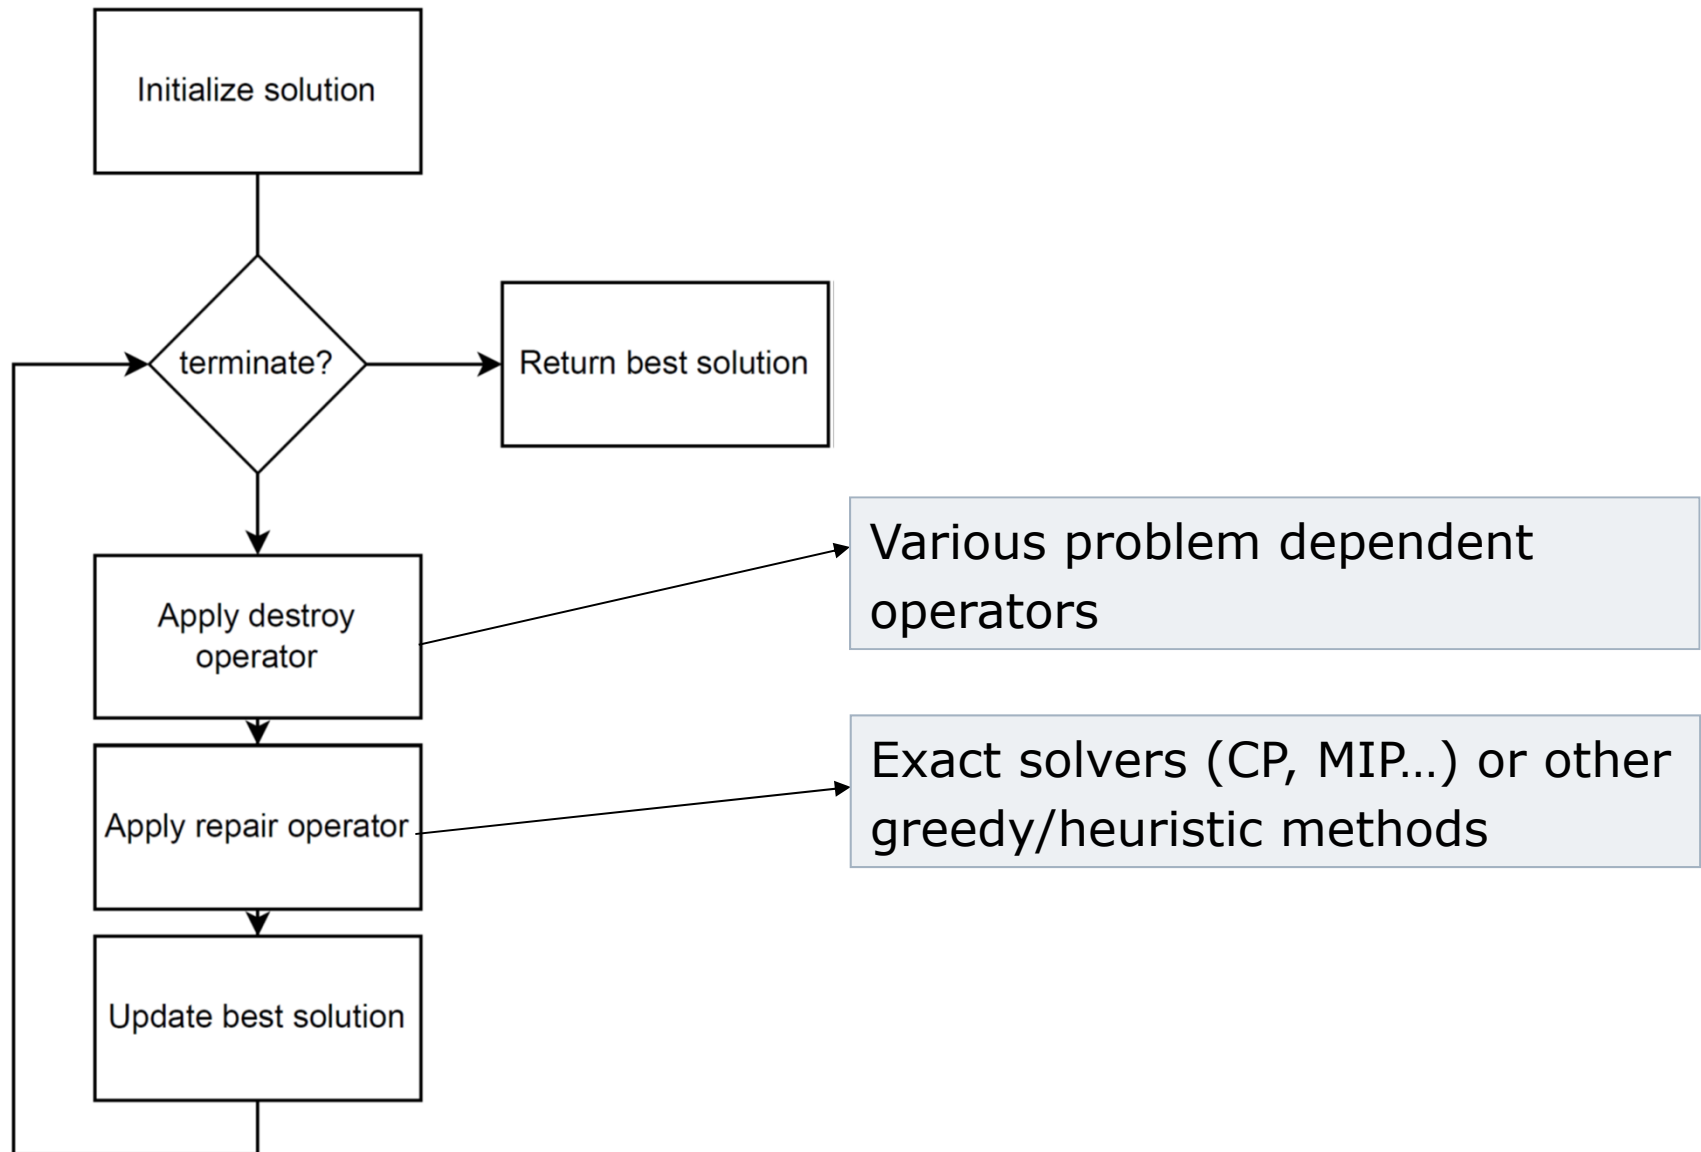

$$\begin{aligned} \text{assigned}[\text{repr}[t], r] = 1 &\implies r \in \mathcal{R}_t \\ &\forall t \in \text{Tasks}, r \in \text{Resources} \end{aligned}$$

Resource requirements:

$$\sum_{r \in \text{Resources}} \text{assigned}[t, r] = \begin{cases} \max_{t' \in \text{Tasks}: \text{repr}[t'] = t} |\text{Req}_{t'}| & \text{if } \text{repr}[t] = t \\ 0 & \text{otherwise} \end{cases} \quad \forall t \in \text{Tasks}$$

# Large neighborhood search

---

# Test Laboratory Scheduling: LNS

---

Repeatedly generate and solve simplified CP instances:

- ▶ Only  $k$  projects can be scheduled, the rest of the schedule is fixed
- ▶ Initially,  $k = 1$ , increases when stuck
- ▶ Tabu list
- ▶ Some scheduling-only steps, with fixed grouping

---

# Metaheuristics

## Local Search Techniques

---

- Based on the neighbourhood of the current solution

- The solution is changed iteratively using neighbourhood relations (moves)
- Acceptable or optimal solutions are often reached

# Local Search Techniques

---

1. Construct the initial solution  $s$
2. Generate neighbourhood  $N(s)$  of solution  $s$
3. Select from the neighbourhood the descendant of the current solution
4. Go to step 2

## Advanced metaheuristic techniques

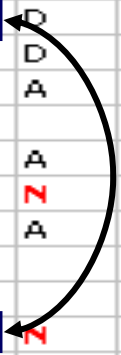

- Simulated Annealing
- Tabu Search
- Iterated Local Search
- Min-Conflicts
- ...

Metaheuristics include a mechanism to escape local optima

## Part 1: Conclusions

---

- Many optimization problems in industry are still solved manually
- AI and optimization offer tremendous potential for further improving solutions in these domains
- Success stories:
  - Test lab scheduling
  - Workforce scheduling
  - Machine scheduling
  - Oven scheduling
  - Educational timetabling, Sport timetabling
  - ...
- No free lunch
  - Combination of AI and optimization techniques is crucial

# Challenges

---

- Automated generation of neighborhoods
- Weights for soft constraints
- Explainability
- Automated modeling
- ...

Automated algorithm selection

Instance space analysis

Hyper-heuristics

Outlook

# Algorithm Selection - Motivation

Often, several search algorithms are available for solving a particular problem

- ▶ **No free lunch theorem**
- ▶ "...for any algorithm, any elevated performance over one class of problems is offset by performance over another class"
- ▶ "...any two algorithms are equivalent when their performance is averaged across all possible problems"

---

Wolpert and Macready, "No free lunch theorems for optimization", 1997  
Wolpert and Macready, "Coevolutionary free lunches", 2005

# Algorithm Selection - Motivation

Often, several search algorithms are available for solving a particular problem

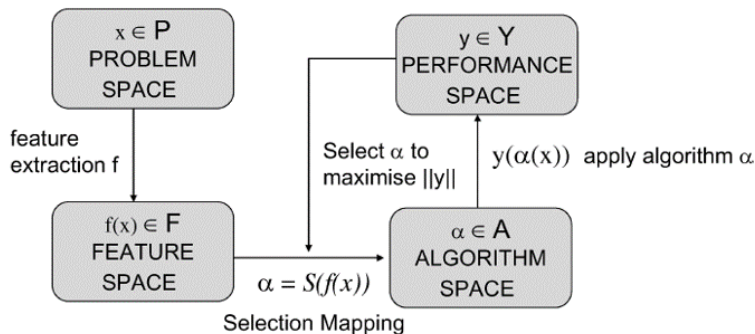

- ▶ **No free lunch theorem**
- ▶ "...for any algorithm, any elevated performance over one class of problems is offset by performance over another class"
- ▶ "...any two algorithms are equivalent when their performance is averaged across all possible problems"

⇒ How to select the best algorithm for a specific problem instance?

---

Wolpert and Macready, "No free lunch theorems for optimization", 1997  
Wolpert and Macready, "Coevolutionary free lunches", 2005

# Algorithm Selection Problem, Rice (1976)

---

Rice, "The algorithm selection problem", 1976

Smith-Miles, "Cross-disciplinary perspectives on meta-learning for algorithm selection", 2009

# Algorithm Selection Problem, Rice (1976)

Input:

- ▶ **Problem space**  $P$  that represents the set of instances of a problem class
- ▶ **Feature space**  $F$  that contains measurable characteristics of the instances generated by a computational feature extraction process applied to  $P$
- ▶ Set of considered **algorithms**  $A$  for tackling the problem
- ▶ **Performance space**  $Y$  maps application of an algorithm on an instance to a set of performance metrics

**Algorithm Selection Problem:** For a given problem instance  $x \in P$ , with features  $f(x) \in F$ , find the selection mapping  $S(f(x))$  into the algorithm space, such that the selected algorithm  $\alpha \in A$  maximizes the performance mapping  $y(\alpha(x)) \in Y$ .

# Back to the Example: Rotating Workforce Scheduling

- ▶ Varying demand for different shifts

Shift	Mon	Tue	Wed	Thu	Fri	Sat	Sun
D	1	1	1	1	1	1	1
A	1	1	1	1	1	1	0
N	1	1	1	1	1	1	1

- ▶ 4 employees, cyclic schedule
- ▶ Regulations constraining shift assignments
- ▶ 5-7 days on work, 2-4 days off
- ▶ D: 2-5 days, A: 2-4 days, N: 2-3 days
- ▶ No D after A or N, no A after N

# Back to the Example: Rotating Workforce Scheduling

Problem space  $P$ :

- ▶ 20 initial real-life instances
- ▶ 2000 generated instances

---

Kletzander et al., “Exact methods for extended rotating workforce scheduling problems”, 2019

Musliu, “Heuristic methods for automatic rotating workforce scheduling”, 2006

# Back to the Example: Rotating Workforce Scheduling

Problem space  $P$ :

- ▶ 20 initial real-life instances
- ▶ 2000 generated instances

Algorithm space  $A$ :

- ▶ Constraint programming model:
  - ▶ MiniZinc modelling language
  - ▶ Lazy clause generation solver Chuffed
- ▶ Metaheuristic combining methods from:
  - ▶ Min-conflict heuristics
  - ▶ Tabu search
  - ▶ Random walk

---

Kletzander et al., “Exact methods for extended rotating workforce scheduling problems”, 2019

Musliu, “Heuristic methods for automatic rotating workforce scheduling”, 2006

# Back to the Example: Rotating Workforce Scheduling

Performance space  $Y$ :

- ▶ Satisfaction problem
- ▶ Measure runtime to feasible solution (timeout 1000 seconds)

# Back to the Example: Rotating Workforce Scheduling

Performance space  $Y$ :

- ▶ Satisfaction problem
- ▶ Measure runtime to feasible solution (timeout 1000 seconds)

Feature space  $F$ : How to get features from instance data?

- ▶  $n$  employees
- ▶ Length of schedule  $w$
- ▶ Set of work shifts  $\mathbf{A}$  + day off  $O$ ,  $\mathbf{A}^+ = \mathbf{A} \cup \{O\}$
- ▶ Temporal requirement matrix  $R$
- ▶ Min and max work block length  $\ell_w$  and  $u_w$
- ▶ Min and max block lengths for shifts and days off  $\ell_s$  and  $u_s$  ( $s \in \mathbf{A}^+$ )
- ▶ Set of forbidden sequences  $\mathbf{F}$

# Direct Instance Features

Take instance data to directly use as features:

- ▶ Number of employees  $n$
- ▶ Number of shifts  $m$
- ▶ Minimum and maximum length of work blocks  $\ell_w$  and  $u_w$  as well as blocks off shift  $\ell_o$  and  $u_o$ .
- ▶ Minimum, maximum and average for each of the sets  $\{\ell_s \mid s \in \mathbf{A}\}$  and  $\{u_s \mid s \in \mathbf{A}\}$ .
- ▶ Number of forbidden sequences  $f$ .

# Advanced Instance Features

Compute features from relations, matrices, graphs, ...

- ▶ *workFraction*: Percentage of all days spent working
- ▶ *shiftFraction*: Distribution of requirements between shifts
- ▶ *blockTightness*:  $blockTightness = up - low$
- ▶ *avgBlockLength*: Lower and upper bound for the average block length
- ▶ *shiftBlockTightness*: Freedom in choosing block lengths for individual shift types
- ▶ *shiftDayFactor*: Regularity of shifts throughout the week
- ▶ *dayFraction*: Workload in relation to the number of employees for individual days
- ▶ *dailyChange*: Change in workload between consecutive days

# Model Features

Run fast algorithm initializations, heuristics, ...

- ▶ MiniZinc to FlatZinc conversion statistics
  - ▶ Number of boolean and interger variables
  - ▶ Number of boolean and integer constraints
- ▶ Initialization in Chuffed:
  - ▶ Number of variables, propagators, SAT variables
  - ▶ Number of binary, ternary, and long clauses
  - ▶ Average length of long clauses

# Algorithm Selection

Use any supervised machine learning approach of your choice:

- ▶ Bayesian Networks
- ▶ Decision Trees
- ▶ k-Nearest Neighbor
- ▶ Random Forests
- ▶ Multilayer Perceptrons
- ▶ Support Vector Machines
- ▶ Deep Neural Networks

# Algorithm Selection and Analysis for RWS

- ▶ Method: Random Forests
- ▶ Chuffed vs. metaheuristic: accuracy 80%
- ▶ Predict timeout: accuracy 93%
- ▶ Feasible vs. infeasible: accuracy 98%
- ▶ Regression on magnitude of runtime: correlation 0.7 to 0.8

# Learning within Algorithms

In this tutorial section: Decision between different algorithms

Other option: Selection / learning within algorithms

- ▶ Later in this tutorial: Learning to select algorithm components (hyper-heuristics)
- ▶ Example for tree search: Variable / value selection

# Learning without Features

Finding adequate features is one of the main challenges in algorithm selection

⇒ What about algorithm selection without features?

- ▶ Recent research direction
- ▶ Directly use instance data as time series for Recurrent Neural Network (RNN)
- ▶ Application to online 1D bin packing

---

Alissa, Sim, and Hart, “Automated algorithm selection: from feature-based to feature-free approaches”, 2023

Automated algorithm selection

Instance space analysis

Hyper-heuristics

Outlook

# Instance Space Analysis - Motivation

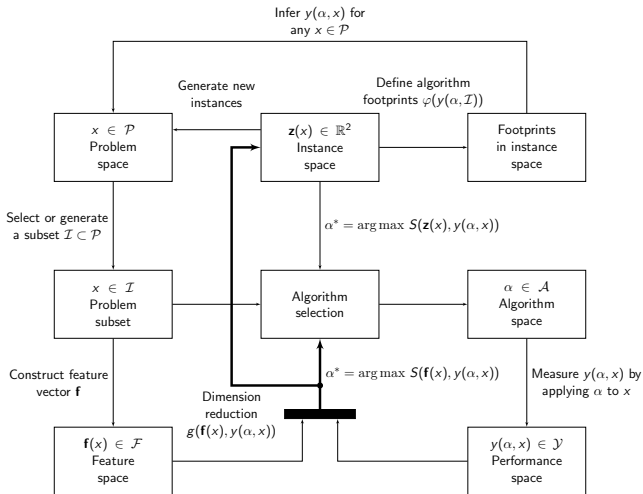

How do we analyze which method works well on which instances?

How do we evaluate a new method for our problem?

- ▶ Use benchmark instances
- ▶ Better in the average?
- ▶ Better in certain cases?
- ▶ Do the benchmark instances cover all interesting areas?

⇒ How to check instances and features to make sure that we can properly identify strengths and weaknesses of different algorithms?

# Extending Rice's Framework, Smith-Miles et. al. (2014)

Smith-Miles et al., "Towards objective measures of algorithm performance across instance space", 2014

# Extending Rice's Framework, Smith-Miles et. al. (2014)

Extensions to Rice's framework:

- ▶ Separation of **Problem space**  $P$  and available **sub-space of instances**  $I$
- ▶ **2-dimensional instance space** for visualization of instance and features distributions
- ▶ Selection mapping can either be computed from the feature space or from the instance space
- ▶ Performance can be visualized in the instance space and inferred for unseen instances

# Instance Space Analysis

Goals:

- ▶ Visualize distribution and diversity of instances
- ▶ Assess adequacy of features
- ▶ Identify regions of strength **footprints** and weaknesses
- ▶ Infer where additional instances might be needed

---

Smith-Miles and Muñoz, “Instance Space Analysis for Algorithm Testing: Methodology and Software Tools”, 2023

# Instance Space Analysis

Goals:

- ▶ Visualize distribution and diversity of instances
- ▶ Assess adequacy of features
- ▶ Identify regions of strength **footprints** and weaknesses
- ▶ Infer where additional instances might be needed

# Back to the Example: Rotating Workforce Scheduling

## **Sub-space of instances /:**

- ▶ 20 initial real-life instances
- ▶ 2000 generated instances

---

Kletzander et al., “Exact methods for extended rotating workforce scheduling problems”, 2019

Musliu, “Heuristic methods for automatic rotating workforce scheduling”, 2006

# Back to the Example: Rotating Workforce Scheduling

## Sub-space of instances $I$ :

- ▶ 20 initial real-life instances
- ▶ 2000 generated instances

## Algorithm space $A$ :

- ▶ **2 constraint programming models:**
  - ▶ Model 2 extends model 1 by additional constraint to check sequences at the start of each block
- ▶ Metaheuristic

Same performance space  $Y$  (runtime) and feature space  $F$

---

Kletzander et al., "Exact methods for extended rotating workforce scheduling problems", 2019

Musliu, "Heuristic methods for automatic rotating workforce scheduling", 2006

# Original Projection

- ▶ Bound extreme outliers
- ▶ Normalization using Box-Cox and Z transformation
- ▶ Remove low diversity features
- ▶ Retain features with high correlation to performance
- ▶ Clustering

---

Kletzander, Musliu, and Smith-Miles, "Instance space analysis for a personnel scheduling problem", 2021

# Original Projection

- ▶ Bound extreme outliers
- ▶ Normalization using Box-Cox and Z transformation
- ▶ Remove low diversity features
- ▶ Retain features with high correlation to performance
- ▶ Clustering

$$\begin{pmatrix} z_1 \\ z_2 \end{pmatrix} = \begin{pmatrix} -0.45 & -0.39 \\ 0.45 & 0.40 \\ 0.50 & 0.08 \\ -0.32 & 0.37 \\ 0.23 & -0.63 \end{pmatrix}^T \cdot \begin{pmatrix} \textit{maxShiftDayFactor}' \\ \textit{maxDayFraction}' \\ \textit{employees}' \\ \textit{minAvgBlockLength}' \\ \textit{blockTightness}' \end{pmatrix}$$

---

Kletzander, Musliu, and Smith-Miles, “Instance space analysis for a personnel scheduling problem”, 2021

# Original Feature Distribution

*employees*

*blockTightness*

*minAvgBlockLength*

*maxShiftDayFactor*

*maxDayFraction*

# Original Feature Distribution

- ▶ Good visualization of feature distribution
- ▶ Most influential features:
  - ▶ Possible block length distributions (*blockTightness*, *minAvgBlockLength*)
  - ▶ Instance size (*employees*)
  - ▶ Distribution throughout the week (*maxShiftDayFactor*)
  - ▶ Daily workload (*maxDayFraction*)
- ▶ 2 separated visible clusters
- ▶ Several real-life instances are outliers

# Original Feature Distribution

- ▶ Good visualization of feature distribution
- ▶ Most influential features:
  - ▶ Possible block length distributions (*blockTightness*, *minAvgBlockLength*)
  - ▶ Instance size (*employees*)
  - ▶ Distribution throughout the week (*maxShiftDayFactor*)
  - ▶ Daily workload (*maxDayFraction*)
- ▶ 2 separated visible clusters
- ▶ Several real-life instances are outliers

Analysis indicates more instances would be beneficial

- ▶ Adapt instance generator
  - ▶ Cover gap
  - ▶ Include real-life instances
  - ▶ Increase number of employees
- ▶ Added 3480 new instances

# Extended Instances

# Extended Instances

$$\begin{pmatrix} z_1 \\ z_2 \end{pmatrix} = \begin{pmatrix} -0.31 & 0.31 \\ 0.02 & -0.57 \\ -0.47 & -0.08 \\ 0.44 & 0.15 \end{pmatrix}^T \cdot \begin{pmatrix} \text{minDayFraction}' \\ \text{maxDayFraction}' \\ \text{maxAvgBlockLength}' \\ \text{minAvgBlockLength}' \end{pmatrix}$$

# Extended Instance Set - Feature Distribution

*minAvgBlockLength*

*maxAvgBlockLength*

*minDayFraction*

*maxDayFraction*

# Extended Instance Set - Feature Distribution

- ▶  $z_1$ : Axis for *avgBlockLength*
  - ▶ Low minimum and high maximum on the left
  - ▶ High minimum and low maximum on the right
- ▶  $z_2$ : Axis for *dayFraction*
  - ▶ Low minimum and high maximum on the bottom
  - ▶ High minimum and low maximum on the top
- ▶ Gap is closed and real-life instances are well covered

# Algorithm Results - Feasibility

Chuffed model 2

Metaheuristic

All methods combined

Number of results

# Algorithm Results - Footprints

Chuffed model 1

Chuffed model 2

Metaheuristic

SVM portfolio

# Algorithm Results

- ▶ Clearly visible boundaries between feasibility and infeasibility
  - ▶ Due to bounds for number of blocks on  $z_1$ -axis
  - ▶ Due to high demand fluctuations on  $z_2$ -axis
- ▶ Instances along this boundary are most difficult
- ▶ Strong and weak areas can be generalized to footprints
- ▶ Algorithm portfolio can be calculated from instance space
  - ▶ Recommended algorithm for each instance
  - ▶ Generalization to further areas can be attempted
  - ▶ Some areas might not have any well-performing algorithms
    - can be reported as hard to solve

⇒ Instance Space Analysis allows deep insights in algorithm behaviour and instance distribution

Automated algorithm selection

# Online Bin Packing

**Goal:** pack sequence of items in as few bins as possible

- ▶ Fixed capacity  $C$  for bins
- ▶ Items packed one-by-one
- ▶ Size of future items unknown

# Online Bin Packing

**Goal:** pack sequence of items in as few bins as possible

- ▶ Fixed capacity  $C$  for bins
- ▶ Items packed one-by-one
- ▶ Size of future items unknown

Popular heuristic: *Best Fit* - Choose (feasible) bin with smallest capacity

# Online Bin Packing - Genetic Programming

- ▶ Compute score for each bin per item
- ▶ Assign to bin with highest score

# Online Bin Packing - Genetic Programming

- ▶ Compute score for each bin per item
- ▶ Assign to bin with highest score
- ▶ Evaluation tree
- ▶ Functions:  $+$ ,  $-$ ,  $*$ ,  $/$
- ▶ Terminals:  $S$ ,  $E$  (*emptiness*, remaining capacity)

30

# Online Bin Packing - Genetic Programming

- ▶ Heuristics evolved on sequences of 100 - 500 items
- ▶ Evaluated on much longer sequences (up to 100000)
- ▶ Best Fit better up to half size of training sequences, then evolved heuristics take the lead

---

Burke et al., "The scalability of evolved on line bin packing heuristics", 2007

Tauritz and Woodward, "Generative Hyper-Heuristics", 2022

# Online Bin Packing - Genetic Programming

- ▶ Heuristics evolved on sequences of 100 - 500 items
- ▶ Evaluated on much longer sequences (up to 100000)
- ▶ Best Fit better up to half size of training sequences, then evolved heuristics take the lead
- ▶ Intuition: Item of size 20 may fit in gap of size 30, but better item (size 25-30) is likely to come along eventually.

---

Burke et al., "The scalability of evolved on line bin packing heuristics", 2007

Tauritz and Woodward, "Generative Hyper-Heuristics", 2022 

# Online Bin Packing - Genetic Programming

- ▶ Heuristics evolved on sequences of 100 - 500 items
- ▶ Evaluated on much longer sequences (up to 100000)
- ▶ Best Fit better up to half size of training sequences, then evolved heuristics take the lead
- ▶ Intuition: Item of size 20 may fit in gap of size 30, but better item (size 25-30) is likely to come along eventually.

**Other applications:** Black-box search operators, graph partitioning, graph generation, ...

Automated algorithm selection

Instance space analysis

Hyper-heuristics

Outlook

# Preference Explanation and Decision Support for Multi-Objective Real-World Test Laboratory Scheduling

- ▶ Preference weights for multi-objective problems can be challenging to determine
- ▶ Shapley values can be used to capture relationships between objectives and provide useful suggestions for weight updates
- ▶ Case study: Decision support system for multi-objective TLSP

■ success (best) ■ success ■ neutral (best) ■ neutral ■ failure

(a) *uniform*,  
 $\gamma = 1.5$

(b) *uniform*,  
 $\gamma = 10$

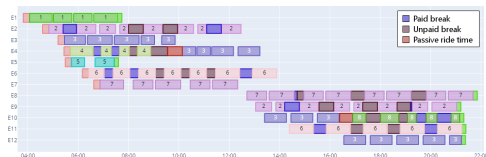

(c) *exponential*,  
 $\gamma = 1.5$

(d) *exponential*,  
 $\gamma = 10$

# Investigating Large Neighbourhood Search for Bus Driver Scheduling

- ▶ Hybrid solution method for complex real-life scheduling problem
- ▶ Select meaningful subproblem based on problem structure
- ▶ Solve subproblem (almost) exactly using Column Generation
